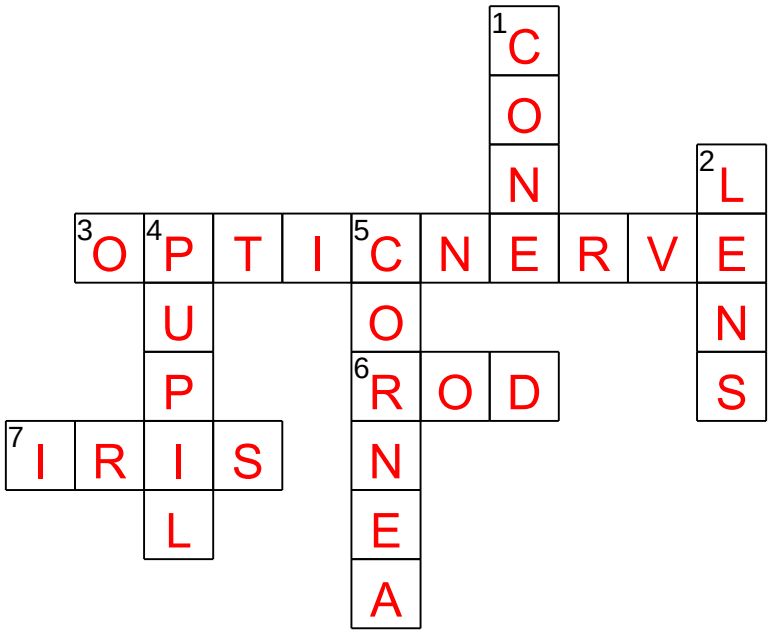
THE EYE

Complete the activity.



ACROSS

3. the thick nerve extending from the eye to the brain which transports the images that the eye receives to the brain
6. are photoreceptor cells in the retina of the eye that can function in less intense light
7. The colored diaphragm in the anterior chamber of the eyeball which contracts and expands to adjust for light intensity.

DOWN

1. photoreceptor cells in the retina of the eye that function best in relatively bright light.
2. focuses light rays onto the retina. It is normally capable of changing shape to allow the eye to focus on both near and distant images.
4. The opening in the center of the iris through which light passes.
5. The transparent part of the eyeball which covers the iris and pupil.
